SUMMARY

Computer Science graduate specializing in Cloud Computing and Virtualization Technology. Project experience with containerized applications, GitHub Actions CI, REST APIs and automated tests. Seeking an entry-level cloud, DevOps trainee or infrastructure support role.

EDUCATION

Bachelor of Technology in Computer Science | 2021 - 2025

University of Petroleum and Energy Studies, Dehradun
Specialization: Cloud Computing and Virtualization Technology

TECHNICAL SKILLS

Programming: Python, Java, JavaScript, TypeScript

Deployment and development: Docker, Docker Compose, Git, GitHub Actions CI, Node.js, REST APIs

Testing and reliability: Playwright, Vitest, API validation, health checks, container smoke tests

Project technologies: React, Hono, Zod, Cloudflare Workers, pandas, scikit-learn

TECHNICAL PROJECTS

Arovia Disease Research and Hospital Directory

github.com/surajsuman23/disease-hospital-recommender | Live application

Python | React | TypeScript | Hono | Docker | GitHub Actions

- React and TypeScript frontend connects to a Hono API through shared Zod schemas; five screens cover assessment, ranked results, hospital listings and model information.
- Docker deployment runs as a non-root user; GitHub Actions checks application tests, browser flows and container readiness. Hosted runtime uses Cloudflare Workers through Sites.
- API includes health endpoints, request validation and a shared request budget. Three real Bengaluru hospitals are ranked by Haversine distance.

CPU Scheduling Simulator

github.com/surajsuman23/cpu-scheduling-simulator | Live application

Java | JavaScript | Node.js | Docker | GitHub Actions

- Java CLI and Node.js API compare FCFS, non-preemptive SJF and Round Robin; frontend shows Gantt charts, execution traces, waiting times and turnaround times.
- Validates workloads and timing invariants; repository includes 300 seeded randomized schedule checks, automated API tests and an independent Docker deployment.

Diabetes Classification Benchmark

github.com/surajsuman23/diabetes-prediction-system | Live application

Python | pandas | scikit-learn | Node.js | Docker

- Python benchmark compares KNN, Gaussian Naive Bayes and a majority baseline on 768 OpenML records, with training-only preprocessing and a separate 192-record test set.
- Node.js backend serves reference results; interactive experiments run Python in a browser worker. CI checks API behavior, browser flows and Docker readiness.
